Credit Name: CSE3110 - Iterative Algorithm 1
Assignment Name: ReverseList

Q: How has your program changed from planning to coding to now? Please explain?

A: This was actually an easy mastery to do. All I had to do was implement the Stack2 java class code and rename it to reverse list. For the client code to test ReverseList, I created an interface for the user to input 10 numbers or until the user enters in 999 to quit in order to 'push' these numbers. After the user has inputted their numbers, the program will then 'pop' these numbers until there are no more left, making the program print out the numbers in reverse order. After testing the client code, no errors were detected.
