Credit Name: CSE2130 - File Structures & Exception Handling
Assignment Name: FindAndReplace

Q: How has your program changed from planning to coding to now? Please explain?

A: This was also a tricky mastery since modifying an existing and written text file seems a bit confusing to me. So once again, I went to the internet and found an interesting article to help solve my problem. Using this article as my outline and then went to code the mastery without plagiarizing the outline. After coding how the program reads the file, finds the word that the user wants to replace and replaces the word with the user's new word (and closing up both BufferedReader and FileWriter), I finished programming the application and tested the application out. No errors were found during the testing phase.
